## Multi-Effect Dermal Filler Procedure Pack

Calhydra procedure pack increases the collagen in the skin in addition to the fullness effect thanks to the Novuma Collagen Stimulating Dermal Filler included in the package, while REFREJ Low Cross-Linked Hyaluronic Acid Intradermal Filler provides a natural effect

with effective performance in the restoration of skin brightness and skin hydration. The multifaceted effect of Calhydra offers a significant increase in skin quality in a single session with volume restoration and subsequent collagen stimulation at the time of application.

The lidocaine content can offer patients more comfort in treatment.

The high-molecular-weight (2.7 MDa) hyaluronic acid it contains provides a more vibrant and tighter skin appearance by increasing the moisture retention capacity of dehydrated and degenerated

skins. Its structure with a low degree of crosslinking at a rate of 3% offers an effective treatment option in the correction of fine lines and skin depressions, as well as brightening the skin.

### Increased Fibroblast Count

Activates fibroblasts and increases cell proliferation by over 35% thanks to its high calcium hydroxyapatite content

### Collagen Stimulation

Supports the formation of new collagen (neocollagenesis) thanks to the biostimulating effect of calcium hydroxyapatite microspheres it contains

### Instant Volume Effect

Provides a high volume effect that starts immediately after the injection thanks to the cellulose and hyaluronic acid in its content.

### Increased Skin Quality

Increases the skin quality and thickness in a short time with increased collagen. Offers a lively and bright skin appearance instead of the pale and blemished look of the skin.

### Elasticity Gain

The increased fibroblast amount enables elastogenesis, restoring the elasticity lost by the skin with the elastin increase.
